

Giving structure to software Dev Projects

- In Software development, project tracking is a method of organization to observe potential and actual states of a project.
- These tools facilitate project management in a structured format such as GitHub's "Projects"
- These projects can come from a to-do list populated with tracked issues and involve potential fixes in the form of pull requests
- In my experience (GitHub's Project tracking), these tools can reduce ambiguity about the status of a working project. They also create framework for teams to identify next projects without collision with other teams. This increased organization only helps to benefit overall efficiency of Software Development!
